## GPT 4

Just as we thought chatGPT from openAI was revolutionary, the same company goes ahead and announces the release of GPT4, a better version of the AI with thrilling abilities including an incredible way to decipher images, describe their features, give possible examples relating to the images and even determine the location and use of the images. Now this is revolutionary. However, they have only depicted that we shouldn't settle for just that because they might just ambush us with an even better version of the AI, who knows.

With the ability to learn from a tremendous amount of data, stopping or controlling this system is not a promising idea since it only shows that it has learnt the many different ways of displaying content, breaking it and reassembling it. GPT4 might is also able to present information like an all levels human would do, that is a highly intellectual and vocabularies information, an averagely comprehensive information and a deeply explained piece of information. This makes it very useful therefore cannot be ignored.
